NHS Feedback for 2009/10**

NHS Trust based - Mothers Initiating Breastfeeding

Background / Introduction

Since 2005/06, the Care Quality Commission (CQC) formerly the Healthcare Commission (HCC) has collected data on smoking during pregnancy and breastfeeding initiation annually from NHS Trusts to assess infant health & inequalities.

There is clear evidence that breastfeeding has positive health benefits for both mother and baby in the short- and longer-term (beyond the period of breastfeeding). Breastmilk is the best form of nutrition for infants and exclusive breastfeeding is recommended for the first six months (26 weeks) of an infant's life. Thereafter breastfeeding should continue for as long as the mother and baby wish, while gradually introducing a more varied diet.

Babies who are not breastfed are many times more likely to acquire illnesses such as gastroenteritis and respiratory infections in the first year. In addition, there is some evidence that babies who are not breastfed are more likely to become obese in later childhood. Mothers who do not breastfeed have an increased risk of breast and ovarian cancers and may find it more difficult to return to their pre-pregnancy weight.

Once a year in March, SHAs performance managers are asked to name NHS Trusts in their boundaries that they feel should be asked to submit data for each of the CQC returns.

Once a year in April, each NHS Trusts is required to send the following three numbers to the Care Quality Commission based on the activity that took place in the previous financial year.

- The actual number of maternities
- The actual number of mothers known to initiate breastfeeding
- The actual number of mothers known not to initiate breastfeeding

The number of maternities is defined as the number of women who gave birth to one or more live or still born babies of at least 24 weeks gestation where the baby was delivered by either a midwife or a doctor and the place of delivery was an NHS hospital within the trust. Exclude all maternities that occurred in either psychiatric or private beds.

The mother is defined as having initiated breastfeeding if, within the first 48 hours of birth, either she puts the baby to the breast or the baby is given any of the mother's breast milk.

During the lifetime of this return, the minimum coverage requirements have changed. The CQC indicator definition informs Trusts what the coverage requirement are for the CQC to calculate breastfeeding initiation and smoking at delivery. Since 2005/06 they have changed as follows

2005/06 - 85% coverage
2006/07 - 85% coverage
2007/08 - 90% coverage
2008/09 - 95% coverage
2009/10 - 95% coverage

Trusts are informed that a high percentage of maternities with breastfeeding status not known will impact upon performance against this indicator. Trusts reporting more than 5% of status not known for 2009/10 data submission will fail this validation and will be categorised as 'data not returned' for indicator 1 and indicator 3 accordingly. This may result in a fail for the overall indicator.

The following link give you access to full indicator level dataset for the 2009/2010 benchmarking. The dataset for National priorities.
